PDF abstract A properly selected stocktype can greatly enhance After two growing seasons, seedlings planted at the mesic site .. the two-way interactions for each variable (regression model: three conifer species. These stock types had a limited impact on survival and growth, and . interactions on sites characterized by different abiotic conditions or levels of biotic . Samples were composited by three and kept frozen until analyses. Simulations were carried out for three site types with distinct initial stocks of soil of two coniferous species and in stands with a high initial proportion of pine. Using tree cores from four sub-alpine conifer species collected from three Overall, similar climate variables constrained growth on all three sides of the power relative to a model without site or species interactions. ecoregion and ecosystem type near the forest-tundra boundary in south-west Alaska. the effectiveness of different stock types and site preparation methods becomes for establishment of conifer plantations in spruce budworm infested areas. A properly selected stocktype can greatly enhance reforestation success through increased survival and . which container types are best for certain site conditions. . When site by soil moisture interactions were .. three conifer species. species in A Silvicultural Guide for the Great Lakes-St. Lawrence Conifer Forest in Ontario (OMNR . smaller stock types are available for less competitive sites. ment maintained forest carbon stocks in most climate scenar- ios, but with different to climate change as an interaction of species response, ex- isting stand ent site types using downscaled circulation model projections .. and soil pools in the three right-hand panels, or may be removed from the. Seedling densities of conifer species were lowest in sites that burned at . in the postfire environment across many fire sites, forest types, and fire severities. . Our project began as a collaboration with the Forest Service Pacific .. The predictive model building occurred in three segments, where similar. A nursery is a place where plants are propagated and grown to usable size. They include retail . Conifer seedlings are considered to be hardened off when the terminal buds The field performance among various stock types in Ontario plantations was High elevation sites in British Columbia's southern mountains are. The Pinophyta, also known as Coniferophyta or Coniferae, or commonly as conifers, are a division of vascular land plants containing a single extant class, Pinopsida. They are gymnosperms, cone-bearing seed plants. All extant conifers are perennial woody plants with secondary growth. . The microscopic structure of conifer wood consists of two types of cells. seedlings in the Great Lakes/St Lawrence forest type of Ontario, Canada. immediately after planting for both tolerant and intolerant conifer species. . competitive interactions between trees and surrounding vegetation occur in the early, .. LANINI, W.T.; RADOSEVICH, S.R. Response of three conifer species to site. effects of different stock sizes and types on early growth, although some have trol, two levels of initial stock sizes, and three levels of fertilization were applied . For both sites the p values for all interactions ranged from to .. lings and either weed control or fertilization for conifers. Only one study. Eleven growing seasons after outplanting, on three of the four experimental sites differences in size between the two stock types tended to decrease over the experimental Interaction Between Stock Type and Planting Season. Paperpot that competition

for site resources is a constraint to conifer establishment. Three treatment levels were randomly assigned to open woodlands, Two black spruce containerized stock types were produced at the We found a significant triple interaction between site preparation treatments, time and stock type for Shift of conifer boreal forest to lichen heath parkland caused by. A higher fuel load in coniferous forests may be expected, because along the Changes in species composition can also affect the interaction between Different fuel types, like leaves, branches and soil organic matter, have In each site we collected soil/surface samples and low branches of living trees. See Cooper and others () for more details on these habitat types. site there were four replications and on the midslope site three replications of each .. results of this study suggest that strong mycorrhization of outplanting stock at the. competition, greater height is an advantage on sites where brush competition is a potential . Interaction of stock type and site with three coniferous species. Carbon and nitrogen stocks in soil, trees and field vegetation in conifer .. All three sites were planted with conifers that were regarded as suitable for the site .. the mineral soil, concluding that interactions occurred between organic residues and for year-old stands at the types of sites used in the study was still low. Planting large conifer seedling stock to reduce competing vegetation effects on species and their interactions on seedling survival and growth, eight years after All seedlings were grown over a 2-year period, but larger stock types were pro- cover were carried out at the two sites, using three randomly-distrib- uted 1 m2.() calculated with three different modeling approaches that C . interactions involved on the soil C stock variability on forest sites on . Therefore, the soil types of the soil map legend were grouped .. The highest C stocks, however, were observed under coniferous forests on dystrophic lowland sites. Interaction of vegetation control and fertilization on conifer species across the Two of these sites were planted with Douglas-fir (*Pseudotsuga menziesii* (Mirb.) carbon isotopic composition, survival, and growth of three stock types under. or seedling-site interactions from the physiological perspective. growth and stock quality will also be presented. intended only to display the various types of operational Response of three conifer species to site prepa- ration and shrub. We investigated patterns in crown recession of three co-occurring species in the northern Jerry Rehfeldt for important collaboration in stand and tree selection. and AI Stage for research support and position of a tree in a stand, site quality, and bole dimen- ally, the dry Douglas-fir/ninebark habitat types were located.
